

Depth × Color Decoupling — Four Conditions (100% swaps)

Field B (delayed, ●□) always coheres S0/S1 non-delayed, ▲◇) always rotates · Both fields swap coherency/rotator plane throughout
Dots/ Depth/ Color/ Dots/ Depth/ Color/

What changes at tStart?

	Cond 1	Cond 2	Cond 3	Cond 4
Field B (●□) depth	Near	Near	→ Far	→ Far
Field B (●□) color	Red	→ Green	Red	→ Green
Field A (▲◇) depth	Far	Far	→ Near	→ Near
Field A (▲◇) color	Grn	→ Red	Grn	→ Red
Translator (B) depth	Near=DFD ✓	Near=DFD ✓	Far≠DFD ✗	Far≠DFD ✗
Translator (B) color	Red=orig ✓	Green≠orig ✗	Red=orig ✓	Green≠orig ✗
Analog	N baseline	S&B Exp 2 color swap	New	= current ZdCoh

Field B (●□, Red) rotates — No swap
Cond 5 — No swap
Field A (▲◇, Green) rotates — Color swap at T₂
Cond 6 — Color swap

Post-onset appearance identical to matched pair 1-4. Only difference: temporal cue (onset) points to the rotator, not the translator. Blue circle = translation window

What changes at tStart? (DFD = Far, ●□ = Field A)

	Cond 5	Cond 6	Cond 7	Cond 8
Field B (●□) depth	Near	Near	→ Far	→ Far
Field B (●□) color	Red	→ Green	Red	→ Green
Field A (▲◇) depth	Far	Far	→ Near	→ Near
 S0 ● Field B coherent (translator)  S2 ▲ Field A coherent (rotator)  Red line = dot is Red  Translation window  S1 □ Field B noise companion  S3 ◇ Field A noise  Green line = dot is Green  → Red
