

Exp_DepthColorLinked — All Condition Types

linkDepthColor=1 · ZdA+ZdB · no baseline · n=256 trials · delayTranslator=true (Field B delayed)

Trial count

CUED / UNCUEd	2	which subfield is the coherent translator (S2 or S0)
Heading	×8	8 translation directions
Rotation config	×2	RotA (S0=CW, S2=CCW) vs RotB (S0=CCW, S2=CW)
Delayed field color	×2	Field B color = Red or Green
Delayed field depth	×2	Field B depth = Near or Far
Swap	×2	ZdA or ZdB (no baseline)
= Total	256	

linkDepthColor=1: what it means

- Each depth plane has one color throughout: the Near plane is always one color, Far always the other.
- When ZdA or ZdB moves a subfield to a new depth plane at tStart, it also changes that subfield's color.
- Result: depth and color change are inseparable — you cannot distinguish which cue drove perception.

Terminology

Field B (delayed):	Sub2+Sub3, hidden before onset (delayTranslator=true). Appears at t_onset.
Field A (always):	Sub0+Sub1, visible from the start. Rotating (aRot direction).
CUED:	S2 is the coherent translator. Temporal cue (Field B onset) correctly marks translator.
UNCUED:	S0 is the coherent translator (in Field A, always present). Temporal cue marks rotator.
ZdA:	At tStart: S0↔S2 exchange depth planes (and colors). The two coherent subfields swap.
ZdB:	At tStart: S1↔S3 exchange depth planes (and colors). The two noise subfields swap.
DelB = Near+Red:	Field B starts in Near plane, Red color. Field A is Far+Green.
DelB = Near+Green:	Field B starts in Near, Green. Field A is Far+Red. (Inverted depth-color.)
DelB = Far+Red:	Field B starts in Far, Red. Field A is Near+Green. (Inverted depth-color.)
DelB = Far+Green:	Field B starts in Far, Green. Field A is Near+Red. (Standard depth-color, Far delayed.)

Depth-color assignment across configs (Near=? Far=?):

Config	DelB	Field A (always)	Near plane color	Far plane color
A	Near+Red	Far+Green	Red	Green
B	Near+Green	Far+Red	Green	Red
C	Far+Red	Near+Green	Green	Red
D	Far+Green	Near+Red	Red	Green

All 16 Condition Types (before ×heading ×rotCfg)

Each row × 2 rotConfigs × 8 headings = 32 trials. 16 rows × 16 = 256 total.

Cfg	Swap	Cued?	Pre-onset (Field A visible)	Onset adds (Field B appears)	What changes at tStart	Translator plane+color at tStart
A	ZdA	CUED	Far+Green	Near+Red	S0: Far→Near (Green→Red) S2: Near→Far (Red→Green)	S2: Far+Green
A	ZdA	UNCUED	Far+Green	Near+Red	S0: Far→Near (Green→Red) S2: Near→Far (Red→Green)	S0: Near+Red
A	ZdB	CUED	Far+Green	Near+Red	S1: Far→Near (Green→Red) S3: Near→Far (Red→Green)	S2: Near+Red

D	ZdB	UNCUED	Near+Red	Far+Green	S1: Near→Far (Red→Green) S3: Far→Near (Green→Red)	S0: Near+Red

Key observations

- 1. linkDepthColor = depth and color are ALWAYS co-varied. You cannot know if depth or color drives the effect.
- 2. Configs A+D: Near=Red, Far=Green. Configs B+C: Near=Green, Far=Red (inverted). Both included.
- 3. In ZdA, the two COHERENT subfields (S0, S2) swap planes/colors. In ZdB, the two NOISE subfields (S1, S3) swap.
- 4. In CUED+ZdA, the translator changes depth+color at tStart. In CUED+ZdB, the translator stays in its original plane.
- 5. CUED: S2 translates (in Field B, appears at onset). UNCUED: S0 translates (in Field A, always visible).
